

One method for solving three equations with three unknowns is stated below.

- 1 Number the equations in the system 1, 2, and 3.
- 2 Choose any variable to eliminate.
- 3 Pick any two of the equations from the original system and use the elimination method. Call the result equation #4.
- 4 Go back to the original system and pick **two different** equations from the system. Eliminate the **same** variable by using the elimination method. Call the result equation #5.
- 5 Use equations #4 and #5 together to eliminate a second variable by the elimination method. This will give you one of your unknowns.
- 6 Take your solution from step 5 and substitute back into equation #4 or #5 to find a second unknown.
- 7 Find your third unknown by plugging the two you have into an original equation.
- 8 Write your solution as an ordered triple (x,y,z)
- 9 Check your solution in the original system.

Solve the following systems of equations.

$$\textcircled{1} x - y + z = -1$$

$$\textcircled{2} x + y + 3z = -3$$

$$\textcircled{3} 2x - y + 2z = 0$$

eliminating y

$$2(\textcircled{4}) - y + 2(-3) = 0$$

$$8 - y - 6 = 0$$

$$-y + 2 = 0$$

$$y = 2$$

$$\textcircled{1} x - y + z = -1$$

$$\textcircled{2} x + y + 3z = -3$$

$$\textcircled{4} x + y + 3z = -3$$

$$\textcircled{3} 2x - y + 2z = 0$$

$$\textcircled{4} 2x + 4z = -4$$

$$\textcircled{5} 3x + 5z = -3$$

$$\textcircled{4} \cdot 3 \quad 6x + 12z = -12$$

$$\textcircled{5} \cdot 2 \quad -6x - 10z = 6$$

$$2z = -6$$

$$z = -3$$

plug into

$$3x + 5(-3) = -3$$

$$3x - 15 = -3$$

$$3x = 12$$

$$x = 4, z = -3 \text{ plug into}$$

Solution: $(4, 2, -3)$

$$\begin{aligned} 1. & x - 2y + 3z = 12 \\ 2. & 2x - y - 2z = 5 \\ 3. & 2x + 2y - z = 4 \end{aligned}$$

eliminating y

$$\begin{aligned} 1. & x - 2y + 3z = 12 \\ 3. & + 2x + 2y - z = 4 \\ \hline 4. & 3x + 2z = 16 \end{aligned}$$

$$\begin{aligned} 2. & 2x - 2y - 2z = 10 \\ 3. & + 2x + 2y - z = 4 \\ \hline 5. & 6x - 5z = 14 \end{aligned}$$

$$\begin{aligned} -2 \cdot 4. & -6x - 4z = -32 \\ \text{elim} + 5. & + 6x - 5z = 14 \\ \hline & -9z = -18 \end{aligned}$$

$$\begin{aligned} z = 2 \rightarrow 4. & 3x + 2(2) = 16 \\ & 3x + 4 = 16 \\ & 3x = 12 \\ & x = 4 \end{aligned}$$

$$\begin{aligned} 2. & 2(4) - y - 2(2) = 5 \\ & 8 - y - 4 = 5 \\ & 4 - y = 5 \\ & -y = 1 \\ & y = -1 \end{aligned}$$

$(4, -1, 2)$

* sub case

$$\begin{aligned} 1. & x - 2y + z = -4 \\ 2. & -4x + y - 2z = 1 \\ 3. & 2x + 2y - z = 10 \end{aligned}$$

eliminating z

$$\begin{aligned} 1. & x - 2y + z = -4 \\ 3. & + 2x + 2y - z = 10 \\ \hline & 3x = 6 \end{aligned}$$

$$\begin{aligned} 2. & 1. \quad 2x - 4y + 2z = -8 \\ & 2. \quad -4x + y - 2z = 1 \\ \hline & -2x - 3y = -7 \end{aligned}$$

~~plug into 5~~

plug into 5

$$\begin{aligned} -2(2) - 3y &= -7 \\ -4 - 3y &= -7 \\ -3y &= -3 \\ y &= 1 \end{aligned}$$

$$\begin{aligned} 1. & 2 - 2(1) + z = 4 \\ & 2 - 2 + z = 4 \\ & z = 4 \end{aligned}$$

$(2, 1, 4)$

4. You manage a clothing store and budget \$5400 to restock 200 shirts. You can buy T-shirts for \$12 each, polo shirts for \$24 each, and rugby shirts for \$36 each. Suppose you want to have the same number of T-shirts as polo shirts. How many of each shirt should you buy?

$$\textcircled{1} \quad 12x + 24y + 36z = 5400$$

$$\textcircled{2} \quad x + y + z = 200$$

$$\textcircled{3} \quad x = y$$

$$12x + 24x + 36z = 5400$$

$$\textcircled{4} \quad 36x + 36z = 5400$$

$$x + x + z = 200$$

$$\textcircled{5} \quad 2x + z = 200$$

replace all y's with x's

$$\textcircled{4} \quad 36x + 36z = 5400$$

$$\textcircled{5} \quad -36x - 18z = -3600$$

$$18z = 1800$$

$$z = 100$$

$$2x + 100 = 200$$

$$2x = 100$$

$$x = 50$$

$$y = 50$$
